## Data types in C

Data type	Number of bits	Range	Description
<code>uint8_t</code>	8	0 to 255	Unsigned 8-bit integer
<code>int8_t</code>	8	-128 to 127	Signed 8-bit integer
<code>uint16_t</code>	16	0 to 65,535	Unsigned 16-bit integer
<code>int16_t</code>	16	-32,768 to 32,767	Signed 16-bit integer
<code>float</code>	32	-3.4e+38 to 3.4e+38	Single-precision floating-point
<code>void</code>	-	-	No type

## GPIO library

1. Difference between function declaration and definition in C:
  - **Function declaration** tells the compiler about the existence of a function.
  - **Function definition** actually implements a function.
2. Part of the C code, which uses my GPIO library to toggle LEDs when a push button is pressed. Otherwise, the values of the LEDs do not change. The button is connected to port D:

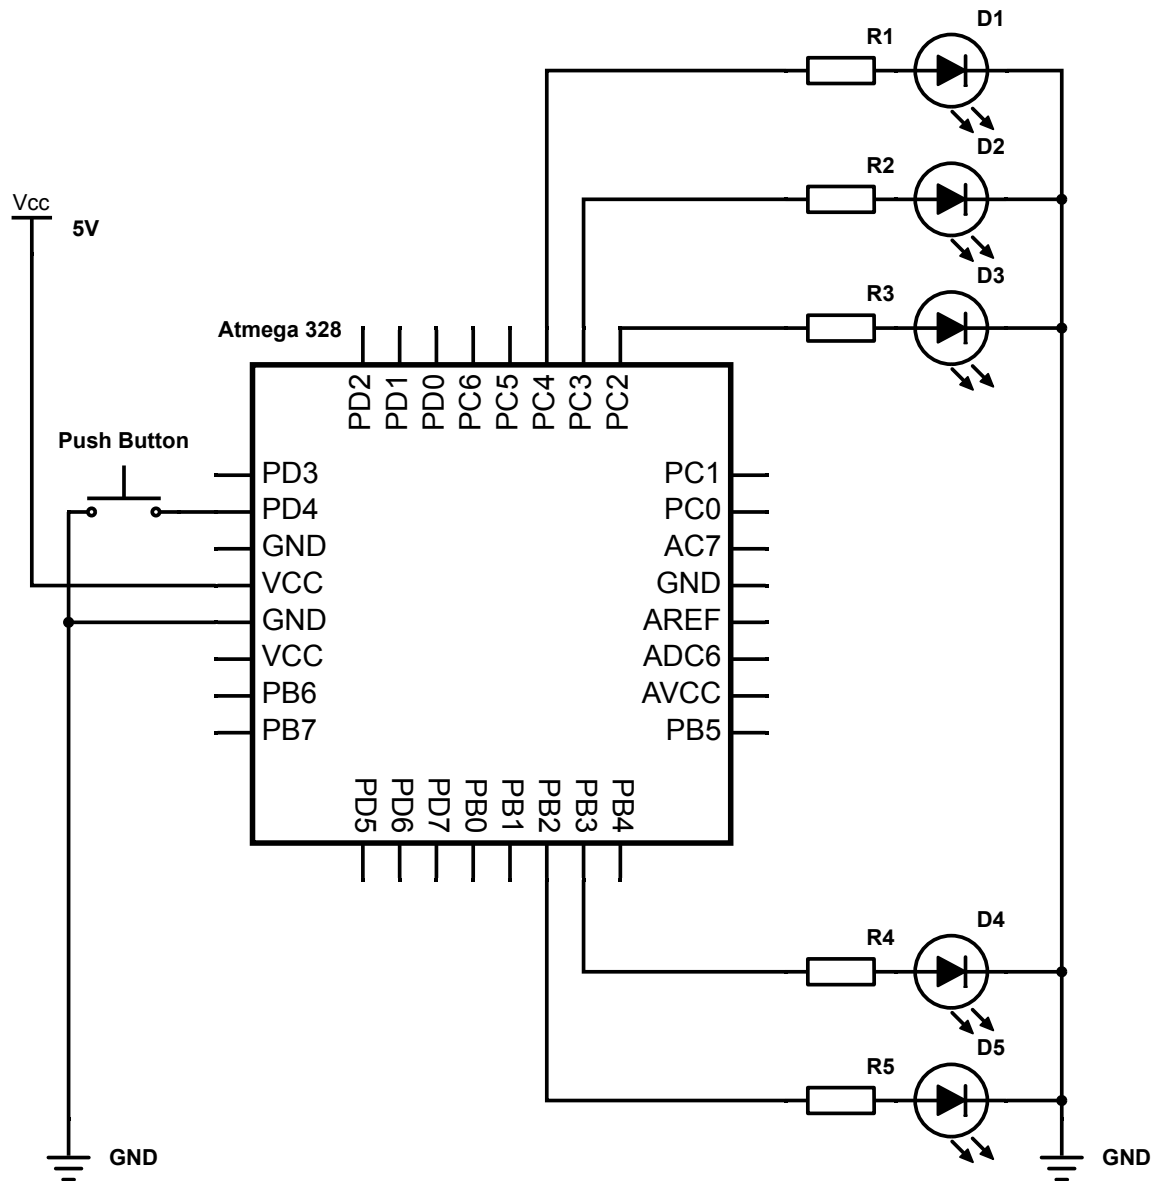

```
// Configure Push button at port D and enable internal pull-up resistor
GPIO_config_input_pullup(&DDRD, PUSH_BTN);

// Infinite loop
while (1)
{
    if (!GPIO_read(&PIND, PUSH_BTN))
    {
        GPIO_toggle(&PORTB, LED_GREEN);
        GPIO_toggle(&PORTC, LED_BREAD);

        while (!GPIO_read(&PIND, PUSH_BTN))
            continue;
    }
}
```

## Traffic light

1. Scheme of traffic light application (connection of AVR device, LEDs, resistors, push button and supply voltage):

Component	Description
D1, D4	Red LEDs
D2	Yellow LED
D3, D4	Green LEDs
R1-R5	Current limiting resistors
